

AGENTIC COMMERCE / RESEARCH BRIEF

# MCP + A2A Integration Guide

An architecture guide for connecting agents to commerce systems without exposing uncontrolled tool access.

01 Read first

02 Propose second

03 Writes gated

# Connection speed increases permission risk.

MCP and A2A can make integrations faster, but they also make tool boundaries more important. Commerce agents should not inherit broad API power just because a protocol makes connection easy. The integration layer should be designed as governed access: narrow schemas, risk-classed tools, identity-bound permissions, budget limits, and audit events around every agent-to-tool or agent-to-agent interaction.

**01**

The protocol is not the governance system.

**02**

Every exposed tool needs a commercial action boundary.

**03**

Agent-to-agent collaboration should not bypass human approval.

## Protocol permission gradient

Protocol adoption should move from read to propose before write or payment capabilities exist.

**MCKINSEY TECHNOLOGY / QUANTUMBLACK / BUILDING THE FOUNDATIONS FOR AGENTIC AI AT SCALE**

Stable interfaces and shared data meaning are prerequisites for scaling agentic AI.

**OECD / THE AGENTIC AI LANDSCAPE AND ITS CONCEPTUAL FOUNDATIONS**

Agentic systems require clearer language around autonomy, coordination, tool use, delegation, and operating environment.

**PARLOA / GLOBAL AI AGENT MANAGEMENT & COMPLIANCE UPDATES**

Agent management platforms are moving audit logs and accountability into product-level controls.

# Protocol readiness controls.

Protocol adoption sequence: discover, read, propose, approve, audit. Public execution stays disabled until controls are proven. Read the artifact as a protocol risk topology: discovery, read, proposal, write, and payment actions need different permission and audit semantics.

## MCP/A2A risk topology

### DISCOVERY

Let agents discover structured capabilities only after purpose, owner, and risk class are known.

### READ

Expose read tools before proposal or write tools, with narrow schema and source visibility.

### PROPOSE

Allow recommendation generation while blocking system-changing actions until approval.

### AUDIT

Log every tool call, agent handoff, approval state, failure, and terminal workflow result.

# Expose the smallest useful protocol surface first.

Use the review to separate read-only tools from proposal and write paths, then prove revocation, denial, and audit behavior.

## INSPECTION QUESTIONS

- Which MCP tools are read-only, proposal-only, financial, or destructive?
- Can the buyer revoke one agent without breaking the whole integration?
- What A2A handoffs are allowed, and where is the audit event?
- Which public MCP or checkout actions remain disabled before legal and budget review?

## DO NOT SHIP UNTIL

- Do not equate MCP availability with permission to execute.
- Do not let A2A chains hide accountability.
- Do not expose payment, refund, discount, or order submission before explicit review.

<b>MAP</b>	List tool surfaces, source systems, risk class, owners, and revocation requirements.	Protocol readiness matrix.
<b>LIMIT</b>	Expose one read-only tool path and one proposal-only path before any live write.	Tool schemas, allowlists, and denied-action tests.
<b>REVIEW</b>	Run integration scenarios with blocked write actions and audit review.	Scenario log and approval-gate evidence.

# Source ledger and protocol boundary

The brief combines external research signals with HARNEXA's implementation boundary: identity, permission, approval, audit, CLEAR evaluation, and no autonomous public execution.
